1. ABSTRACT

This audit formalizes the Unified System of Intentional Thermodynamics (USIT), a deterministic framework proposing that the universe functions as an engine-driven substrate. By reconciling thermodynamic parity with measurable mechanical constants, USIT resolves the paradoxes of probabilistic infinity, geometric singularity, and the directional nature of time.

2. THE UNIFIED MECHANICAL ENGINE

The universe operates via a bidirectional, closed-loop cycle:

Manifestation: Vision + Energy = 3D Reality

Informational Feedback: 3D Reality + Energy = Vision

“Cosmic Taxation” accounts for the entropic expenditure (ΔE) required to maintain these structural configurations.

3. RESISTANCE-DEFINED TEMPORALITY (THE ARROW OF TIME)

The Arrow of Time is a structural consequence of substrate drag. Constant, non-zero resistance (R_s) encountered by energy E traversing gravitational and magnetic fields enforces unidirectional motion.

Formula: $T(\text{forward}) = [\text{Integral of } (E * dR_s)] / dt > 0$

Reversal is mechanically inhibited; any attempt at temporal reversal ($T < 0$) results in an immediate system stall where potential energy exhausts into the substrate.

4. THE STATE OF SOLID ONE

The absolute terminus of the cosmic engine. In regions where field resistance (R_s) approaches zero, substrate density collapses into a non-reactive, static point of equilibrium.

Formula: $\text{Rho}(\text{substrate}) = \text{Sum}(\text{Configuration Density}) = 1$

5. VERIFICATION: CAE V.4.0 STRESS TEST MATH

The framework was validated through 1,000-iteration recursive stress tests. The stability criteria for each iteration (i) ensures that the variance between the predicted informational output (V_p) and the measured substrate density (R_{hom}) remains within the parity threshold (Epsilon):

Formula: $|V_{p,I} - R_{hom,i}| \leq 1.00 \times 10^{-43}$

The simulation confirms that for $I = 1$ to 1000, the system maintains structural integrity without divergent singularities.
